Patent No. 624206

GENERAL INFORMATION:

APPLICANT: Chiou, Xue-Chiou C.

APPLICANT: Riemer, Ruth M.

APPLICANT: Pickard, Richard T.

APPLICANT: Sharp, John D.

TITLE OF INVENTION: HUMAN PHOSPHOLIPASE A2 AND RELATED

TITLE OF INVENTION: NUCLEIC ACID COMPOUNDS

NUMBER OF SEQUENCES: 4

CORRESPONDENCE ADDRESS:
Score 29, DB 3; Length 913; Pred. No. 1.8e+02; 0; Mismatches 9; Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ADDRESSE: Elilily and Company

Patent No. 6339062
GENERAL INFORMATION
APPLICANT: Tuszynski, George
APPLICANT: Williams, Taffy
APPLICANT: Actor, Paul
TITLE OF INVENTION: THEROINVERSO POLYPEPTIDES THAT MIMIC OR INHIBIT
TITLE OF INVENTION: THEROINVERSO PATIVITY
FILE REPERENCE: 07206-0021
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..
                                             GENERAL INCORMATION:

Sequence 5, Application US/07646531D

Patent No. 5200397

GENERAL INFORMATION:
APPLICANT: Deutch, Alan Howard
APPLICANT: TUSTYNSKI, George Paul
TITLE OF INVENTION: Thrombospondin
NUMBER OF SEQUENCES: 20
CORRESPONDENCE ADDRESS:
ADDRESSEE: W. R. Grace & Co.-Conn.
STREET: 7379 Route 32
CITY: Columbia
STARET: 7379 Route 32
CITY: Columbia
STARET: Maryland
COMPUTER REPABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM Compatible
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Word Perfect 5.0
CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/07/646,531D
FILING DATE: 19910131

Sequence 1, Application US/08985526

Patent No. 6080728

GENERAL INFORMATION:
APPLICANT: Mixson, James A

TITLE OF INVENTION: CARRIER:DNA COMPLEXES CONTAINING DNA

TITLE OF INVENTION: THERAPY

TITLE OF INVENTION: THERAPY

NUMBER OF SEQUENCES: 43

CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Score 28; DB 3; Length 209;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                        NESCUENCY 2991A-22823

Sequence 22823, Application US/09252991A

Sequence 228195

Sequence 228195

GENERAL INFORMATION:

APPLICANT: Marc J. Rubenfield et al.

APPLICANT: Marc J. Rubenfield et al.

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING TO PSEUDOMONAS

TITLE OF INVENTION: AERUGINOSA FOR DIAGNOSTICS AND THERAPEUTICS

FILE REPERENCE: 107196.136

CURRENT APPLICATION NUMBER: US 60/074,788

PRIOR FILING DATE: 1999-02-18

PRIOR PRILING DATE: 1999-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-02-18

PRIOR FILING DATE: 1998-07-27

NUMBER OF SEQ ID NOS: 33142

SEQ ID NO 22823

LENGTH: 220
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT 40

GENERAL INPORMATION:
APPLICANT: Hasida, Miyoko

APPLICANT: Teuteuni, No. 6127137iko

APPLICANT: Stringer, Mary Ann

TITLE OF INVENTION: An Acidic Phospholipase, Production, and
TITLE OF INVENTION: An Acidic Discounty of Thereof (As Amended)

TITLE OF INVENTION: Hashoof of Using Thereof (As Amended)

TITLE OF INVENTION WHORER: US/09/295,186B

CURRENT FILING DATE: 1999-04-20

PRIOR PILING DATE: 1999-04-20

Patent No. 6499305

GENERAL INFORMATION:
TITLE OF INVENTION: Methods and Compositions for the TITLE OF INVENTION: Treatment of Ocular Diseases
NUMBER OF SEQUENCES: 7

CORRESPONDENCE ADDRESS: ADDRESSE: Townsend and Townsend and Crew LLP
STREET: Two Embarcadero Center, Eighth Floor
CITY: San Francisco
STATE: California
COUNTRY: USA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     COMPUTER READABLE FORM:

MEDIUM TYPE: Blopy disk

COMPUTER: BM PC compatible

SECTION DATE: BACENTIN Release #1.0, Version #1.30

CURRENT PEPLICATION NUMBER: US/09/075,505

FILING DATE: US-09/075,505

ATTORNEY/AGENT INFORMATION:

NAME: SMITH, TIMOTHY L.

REGISTRATION NUMBER: 016930-003600US

TELEPHONE: (415) 576-0300

INFORMATION FOR SEQ ID NO: 7:

SEQUENCE CHARACTERISTICS:

LENGTH: S50 amino acids

TYPE: Amino acids
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   TYPE: PRT
ORGANISM: Klebsiella pneumoniae

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Re-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.
                                                                                                                                                                                                                                                                                                                                                                     Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium; hydroxyl radical; DNA damage; YggX homologue.

cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterios aserovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from oliveters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of 'UgA' protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant
                                                                                                                         The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium;
hydroxyl radical; DNA damage; YggX homologue.
Reducing superoxide damage to a cell, e.g. bacterial, mammalian or cell, comprises engineering the cell to produce more YggX protein, protein identified from Salmonella enterica Serovar Typhimurium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1 MSRIIFCTYLQRDAEGQDFQLYPGELGKRIYNEISKDAWAQWQHKQTMLINEKKL

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                  plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Superoxide damage, cell; YggX; Salmonella enterica serovar typhimurium; hydroxyl radical; DNA damage; YggX homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  MSRIIFCTYLQRDAEGQDFQLYPGELGKRIYNEISKDAWAQWQHKQTMLINEKKL 55
                                                                                                                                                                                                                                                                                                                             Reducing superoxide damage to a cell, e.g. bacterial, mammalian or cell, comprises engineering the cell to produce more YggX protein, protein identified from Salmonella enterica Serovar Typhimurium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the mative amount of vgaX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of [Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.

                                                                                                                                                                                                                                                                        The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of [Pe-S] clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                        Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium;

                                                                                                                                                                                        The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of vgdX protein (a protein identified from Salmonella enterive amount of vgdX protein or its homolog, where the cells are rendered more resistant to superoxide damage. YgdX reduces the oxidation of fRe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant
                                                                                                                                 plant

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells axidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from of (Fe-S) clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Silmonella enterica serovar typhimurium) or its homolog, where the cells are redared more resistant to superoxide damage. YggX reduces the oxidation of [Re-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells amonella rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Superoxide damage, cell; YggX; Salmonella enterica serovar typhimurium;
hydroxyl radical; DNA damage; YggX homologue.

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from ollusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                   Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium; hydroxyl radical; DNA damage; YggX homologue.

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                      The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of [Pe-S] clusters, and thus reduces the loss of Pe (II) ions from clusters. The resulting decrease in free-iron levels generates fewer reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells amonel rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Superoxide damage, cell; YggX; Salmonella enterica serovar typhimurium; hydroxyl radical; DNA damage; YggX homologue.

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more realistant to superoxide damage. YggX reduces the oxidation of [Pe-S] clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.
                                                                                                                             Superoxide damage, cell; YggX; Salmonella enterica serovar typhimurium; hydroxyl radical; DNA damage; YggX homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Superoxide damage, cell, YggX, Salmonella enterica serovar typhimurium, hydroxyl radical; DNA damage; YggX homologue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YgaX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of fee.5) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB781.47-78 represent YggX homologues. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       plant

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of [Re-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid molecules of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New protein from Neisseria gonorrheae, useful for the manufacture of a medicament for treating or preventing N. gonorrheae infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     .;

                                                                                                                                                                                                                                                                                                                                                        The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica servor typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of [Fe-S] clusters, and thus reduces the loss of Fe [II] ions from clusters. The resulting decrease in free-iron levels generates fewer reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                   plant

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Pe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.
Superoxide damage, cell; YggX; Salmonella enterica serovar typhimurium;
hydroxyl radical; DNA damage; YggX homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Acinetobacter baumannii; bacterial disease; antibacterial; vaccine;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of [Re-S] clusters, and thus reduces the loss of Fe [II] ions from clusters. The resulting decrease in free-iron levels generates fewer reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  plant

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are
                                                                                                                                                                                                                                                          The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for diagnosing a bacterial disease, as components of antibacterial accines, as targets for antibacterial drugs, to detect the presence of A. baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfere with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol agents for plants. The present sequence represents the amino acid sequence of an A. baumannii protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium;
hydroxyl radical; DNA damage; YggX homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.
rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium;
hydroxyl radical; DNA damage; YggX homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the mative amount of YgdX protein (a protein identified from Salmonella enterica servoar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YgdX reduces the oxidation of free-5 dlusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          plant

The method comprises engineering the cell to produce more than the native amount of YgAX protein (a protein identified from Salmonella enterica servoar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YgAX reduces the oxidation of [Fe-S] clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer reducing superoxide damage in a bacterial, yeast, mammalian or plant reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues. (Updated on 29-AUG-2003 to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.
Superoxide damage, cell; YggX; Salmonella enterica serovar typhimurium;
hydroxyl radical; DNA damage; YggX homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Superoxide damage, cell; YggX; Salmonella enterica serovar typhimurium; hydroxyl radical; DNA damage; YggX homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica servar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from of ulusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                                                                    The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are redered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe (II) ions from clusters. The resulting decrease in free-iron levels generates fewer reducing radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                plant

cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homology where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of [Fe-S] clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Reducing superoxide damage to a cell, e.g. bacterial, mammalian or plant cell, comprises engineering the cell to produce more YggX protein, a protein identified from Salmonella enterica Serovar Typhimurium.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the mative amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues
                                                                                                                                                                                                                                                                                                                            Superoxide damage, cell; YggX; Salmonella enterica serovar typhimurium;
hydroxyl radical; DNA damage; YggX homologue.

The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. ABB78147-78 represent YggX homologues

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                  The specification describes a method for reducing superoxide damage to a cell. The method comprises engineering the cell to produce more than the native amount of YggX protein (a protein identified from Salmonella enterica serovar typhimurium) or its homolog, where the cells are rendered more resistant to superoxide damage. YggX reduces the oxidation of (Fe-S) clusters, and thus reduces the loss of Fe(II) ions from clusters. The resulting decrease in free-iron levels generates fewer hydroxyl radicals and thus reduced DNA damage. The method is useful for reducing superoxide damage in a bacterial, yeast, mammalian or plant cell. The present sequence represents a YggX homologue consensus sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Superoxide damage; cell; YggX; Salmonella enterica serovar typhimurium; hydroxyl radical; DNA damage; YggX homologue.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This Alcaligenes eutrophus polyhydroxybutyrate (PHB) polymerase enzyme is essential to the biosynthesis of PHB. The use of recombinant methods for producing such enzymes, required for polyester biopolymer synthesis, allows for the control and modification of the synthesis process. The nucleotide sequence of the PHB operon was obtained from Janes, B. Hollar, J. and Dennis, D. in Dawes, E.A. (ed.) Novel Biodegradable Polymers, Kluwer Academic Publishers, 175-190 (1990). It contains the genes from PHB synthase, 3-ketothiolase and acetoacetyl-CoA reductase. The inventors claim a transgenic plant material contg. foreign DNA encoding a peptide which exhibits 3-ketothilase activity, pref. where the DNA is an open reading from between nucleotides 2696-3877 (phb A gene) that the Capenel or 3952-4692 (phb B gene) of the Alcaligenes eutrophus PHB operon. (Updated on 25-WAR-2003 to correct PN field.)

This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid by modifying by recombinant DNA technology. The invention also comprises a gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above gene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention
                                                                                                                                                                               This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid by modifying by recombinant DNA technology. Sphingans are capsular polysaccharides secreted by bacteria of the genus Sphingans are capsular polysaccharides secreted by bacteria of the genus Sphingans are the invention also relates to a process for preparing clarified sphingans which are useful as galling agents in a variety of food applications for improving the taste, texture, stability and appearance of food products such as dessert gels, confectionery jellies, jams, dairy products, beverages, films and coatings. The sphingans are also useful as the closured modifier in industrial applications such as oil field drilling and cementitious systems. The present sequence is Alcaligenes cutrophus polyhydroxybutyrate (PHB) synthase which is used for the generation of Sphinganonas elodea phaC fragment. phaC DNA fragment concodes polyhydroxybutyrate (PHB) synthase protein. This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid by modifying by recombinant DNA technology. The invention also comprises a gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above gene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid
                                                                                                                                                                                                                                                Modification of a biodegradable polyester synthase, a mutant poly3-hydroxybutanoate synthase, its preparation, a recombinant vector, a transformant, preparation of a biodegradable ester polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Poly3-hydroxyalkanoic acid; biodegradable polyester; mutant; mutein.

The invention also comprises a gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above gene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                       Poly3-hydroxyalkanoic acid; biodegradable polyester; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Poly3-hydroxyalkanoic acid; biodegradable polyester; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Modification of a biodegradable polyester synthase, a mutant poly: hydroxybutanoate synthase, its preparation, a recombinant vector, transformant, preparation of a biodegradable ester polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid by modifying by recombinant DNA technology. The invention also comprises as gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above gene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                     Modification of a biodegradable polyester synthase, a mutant poly3 hydroxybutanoate synthase, its preparation, a recombinant vector, transformant, preparation of a biodegradable ester polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Poly3-hydroxybutanoate synthase mutant associated protein #14.
                                                                  Poly3-hydroxybutanoate synthase mutant associated protein #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Poly3-hydroxyalkanoic acid; biodegradable polyester.
                                                                                                      Poly3-hydroxyalkanoic acid; biodegradable polyester
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ..

                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid by modifying by recombinant DNA technology. The invention also comprises a gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above hgene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention
by modifying by recombinant DNA technology. The invention also comprises a gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above gene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Modification of a biodegradable polyester synthase, a mutant poly3-hydroxybutanoate synthase, its preparation, a recombinant vector, a transformant, preparation of a biodegradable ester polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ..

                                                                                                                                            This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid by modifying by recombinant DNA technology. The invention also comprises a gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above gene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid by modifying by recombinant DNA technology. The invention also comprises a gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above gene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention
                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                     Modification of a biodegradable polyester synthase, a mutant poly3-
hydroxybutanoate synthase, its preparation, a recombinant vector, a
transformant, preparation of a biodegradable ester polymer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Poly3-hydroxyalkanoic acid; biodegradable polyester; mutant; mutein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Modification of a biodegradable polyester synthase, a mutant poly3-
hydroxybutanoate synthase, its preparation, a recombinant vector, a
transformant, preparation of a biodegradable ester polymer.

                                                                 This invention relates to a novel method for the modification of an enzyme participating to the biosynthesis of a poly3-hydroxyalkanoic acid by modifying by recombinant DNA technology. The invention also comprises a gene encoding the above mutant poly3-hydroxybutanoate synthase and a recombinant vector containing the above gene. The method of the invention may be used for the preparation of biodegradable polyesters. The present sequence represents a protein used the method of the invention

Sequence 12, Application US/09955502

Sequence 12, Application US/09955502

Patent No. US2002072118A1

GENERAL INFORMATION:

APPLICANT: Downs, Diana M.

APPLICANT: Grainick, Jeff A.

TITLE OF INVENTION: Method for Preventing Superoxide Damage to Cells and

TITLE OF INVENTION: Method for Preventing Superoxide Damage to Cells and

TITLE OF INVENTION: Oxygen-Labile Proteins

FILE REPRESENCE: 966296.97559

CURRENT APPLICATION NUMBER: US/09/955,502

CURRENT PELLING DATE: 2001-09-18

PRIOR FILING DATE: 2000-09-22

NUMBER OF SEQ ID NOS: 33

SOFTWARE: Patentin Ver. 2.1

LENGTH: 91
                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 11, Application US/0995502

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 10, Application US/09955502

Patent No. US20020072118A1

Patent No. US20020072118A1

APPLICANT: Downs, Diana M.

APPLICANT: Grainick, Jeff A.

TITLE OF INVENTION: Method for Preventing Superoxide Damage to Cells and TITLE OF INVENTION: Method for Preventing Superoxide Damage to Cells and TITLE OF INVENTION: Method for Preventing Superoxide Damage to Cells and TITLE OF INVENTION: Moving No. 1955, 502

CURRENT PAPLICATION NUMBER: US/09/955, 502

CURRENT FILING DATE: 2004-09-18

PRIOR PAPLICATION NUMBER: 60/234, 588

PRIOR PILING DATE: 2006-09-22

NUMBER OF SEQ ID NOS: 33

Sequence 28, Application US/0995502;
Sequence 28, Application US/0995502;
Patent No. US20020072118A1
GENERAL INFORMATION:
APPLICANT: Downs, Diana M.;
APPLICANT: Downs, Diana M.;
TITLE OF INVENTION: Method for Preventing Superoxide Damage to Cells and
TITLE OF INVENTION: Oxygen-Labile Proteins;
TITLE OF INVENTION: Oxygen-Labile Proteins;
TITLE OF INVENTION: 0xygen-Labile Proteins;
FILE REFERENCE: 960296.9759
CURRENT PALLICATION NUMBER: US/09/955,502;
CURRENT PAPLICATION NUMBER: 00/234,588
PRIOR PRILING DATE: 2000-09-22
NUMBER OF SEQ ID NOS: 33
SOFFWARE: Patentin Ver. 2.1
SEQ ID NO 28
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Sequence 27, Application US/09955502 |
